

What to Do if Stung

- First, go quickly to a safe area.
- Scrape – do not pull – stingers from skin as soon as possible. The stinger pumps out most of the venom during the first minute. Pulling the stinger out will likely cause more venom to be injected into the skin.
- Wash sting area with soap and water like any other wound.
- Apply ice pack for a few minutes to relieve pain and swelling.
- Seek medical attention if breathing is troubled, if stung numerous times or if allergic to bee stings.

Don't Forget!

Hives of European honeybees managed by beekeepers play an important role in our lives. These bees are necessary for the pollination of many crops. One-third of our diet relies on honeybee pollination.

If European honeybees were eliminated in an area, Africanized honeybees would quickly fill the gap.

Finally, people can coexist with the Africanized honeybee by learning about the bee and its habits, supporting beekeeping efforts and taking a few precautions.

Remember, exercise caution around any stinging insect. Honeybees are not the only stinging insects people may encounter. Here are a few found in Georgia:

Stinging Insects

Honey bees are not the only stinging insects. People and animals may encounter. This illustration shows some common stinging insects. You should take precautions when encountering any of them.

Be Prepared

Africanized honeybees (AHB) – sometimes called “killer bees” – became established in Texas in 1990 and are spreading to other states including Georgia.

The Africanized honeybee is related to our state’s familiar honeybee (the European honeybee) that produces honey and pollinates our crops. The two types of bees look the same and their behavior is similar in many respects. Each bee can sting only once, and there is no difference between Africanized honeybee venom and that of a European honeybee. However, Africanized honeybees are less predictable and more defensive than European honeybees. They are more likely to defend a greater area around their nest and respond faster and in greater numbers than European honeybees.

In other words, Africanized honeybees are more likely to sting than European ones, but learning about AHB and taking certain precautions can lower your risk of injury.

Here are some tips to remember:

Africanized Honeybees

- Are very defensive of their nest.
- Respond quickly and sting in large numbers.
- Can sense a threat from people or animals 50 feet or more from nest.
- Sense vibrations from power equipment 100 feet or more from nest.
- Will pursue an enemy ¼ mile or more.
- Swarm frequently to establish new nests.
- Nest in small cavities and sheltered areas.

Nest sites include empty boxes, cans, buckets, or other containers; old tires; infrequently used vehicles; lumber piles; holes and cavities in fences, trees, or the ground; sheds, garages and other outbuildings; and low decks or spaces under buildings.

General Precautions

- Be careful wherever bees may be found.
- Listen for buzzing – indicating a nest or swarm of bees.
- Use care when entering sheds or outbuildings where bees may nest.
- Examine work area before using lawn mowers and other power equipment.
- Examine areas before penning pets or livestock.
- Be alert when participating in all outdoor sports and activities.
- Don’t disturb a nest or swarm – contact a pest control company or your county Co-operative Extension office.
- Teach children to respect **all** bees.
- Check with a doctor about bee sting kits and procedures if sensitive to bee stings.
- Remove possible nest sites around home and seal openings larger than 1/8” in walls and around chimneys and plumbing.

As a general rule, stay away from **all** honeybee swarms and colonies. If bees are encountered, get away quickly. If you are stung, try to protect your face and eyes as much as possible and run away from the area. Take shelter in a car or building. Hiding in water or thick brush does **not** offer enough protection. Do not stand and swat at the bees; this will only cause them to sting.
